The BFtec Winged foundation... ... for ramming in

Don't worry about difficult soil types!
The winged foundation
is suitable for...

Build secure foundations on **difficult soils**. Our winged foundation is a **safe and efficient alternative** to the usual ram profiles for the installation of different subconstructions. The **solid displacement pile** with wings offers **maximum stability** and thus enables **higher spaces for elongation**, leading to considerable cost savings in your building project. A further advantage of our winged foundation is the considerably lower "ramming in depth" since it is shorter than normal ram profiles.

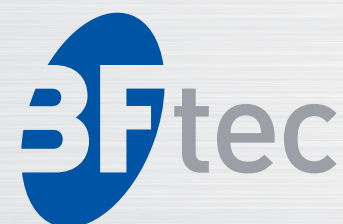

We produce the winged foundations individually and accurately adjusted to your project and the respective frame type. Our development department and our structural engineers guarantee the highest degree of safety.

The advantages at a glance

- Easy installation through ramming in
- Implementation of high span widths compared to the usual ram profiles
- Stability in spite of low ramming in depth
- Cost savings through efficiency
- Individual adaptation to different soil conditions and frame types
- Pile tip pressure and carcass friction like our borefoundation

Feel free to contact us:

We would be glad to personally answer your questions on our winged foundations or to provide information on up-to-date reference objects.

Attachments that fit!

Very stable wings!

Quick assembly!

... sandy and soft soil types

... marshy and uneven areas

... river banks and rivers

... ramming in with
the usual machines
